## RESOURCE MANAGEMENT SYSTEM

Susan Gaye Elkington Randall Hess Michael Dean Walker Jason Richard Huddleston

## **ABSTRACT**

A method of managing critical resource usage comprises monitoring queue depth in at least one critical resource queue for a high level of resource consumption and preventing subsequent commands of a client/server combination in response to a command that increases resource consumption to the high level. The method further comprises queuing an identifier of the client/server combination on a waiting queue, removing the client/server combination identifier from the waiting queue in queuing order as resource consumption declines, and enabling commands of the client/server combination.
